PRODUCT RANGE	16-153
Domestic Drainage	18
Self	20
· Pedestrian use and sporadic car traffic	
· Low hydraulic requirements	
· Channel width 100-150-200-250-300	
· No profile / galvanised profile / stainless steel profile	
Mini	36
· Pedestrian use and sporadic car traffic with height limitation	
· Low hydraulic requirements	
· Channel width 100-150-200-300	
· No profile / galvanised profile / stainless steel profile	
Urban	48
· Pedestrian use and sporadic car traffic	
· All types of hydraulic requirements	
· Channel width 100-150-200-250-300	
· No profile / galvanised profile / stainless steel profile	
· Option of preslope 0.5%.	
· Option of cascaded slope	
Sport	62
· Sports and recreation facilities	
· Channel widths: 100-200	
Hydro	72
· Plastic channels	
· Pedestrian use and sporadic car traffic	
· Low hydraulic requirements	
· Channel widths: 100-200	
Technical drainage	82
MultiV+	84
· Intermediate loads and road traffic	
· Low and medium hydraulic requirements	
· Optimised V-shaped section with self-cleaning effect	
· Rapidlock® locking system	
· 8 locking points per ml	
· Channel widths: 100-150-200	
· Option of preslope 0.5%.	
· Option of cascaded slope	

Civil drainage	100
Civil - S	102
· High loads with height limitation	
· Low hydraulic requirements	
· Channel width 150-200-250-300	
· Locking system Bolted at 8 points per ml	
Civil - F	114
· High loads	
· All types of hydraulic requirements	
· Channel width 100-150-200-250-300-400	
· Locking system Bolted at 8 points per ml	
KompaqDrain®	136
· Monolithic channel	
· Specially designed for heavy traffic	
· For all hydraulic requirements	
· MAXFLOW system, which increases water speed	
· Channel width 100-150-200	
· Option of different surfaces depending on application	
Slotted Gratings	154
· Hidden drainage grating solution	
· Applicable to almost the entire range of channels	
· All types of hydraulic requirements	
· Channel widths 100-150-200-250-300	
· Various slot heights and widths	
Other Solutions	162

CONDITIONS OF SALE	196
--------------------	-----

Who we are

We have been experts in designing, manufacturing and installing high-performance prefabricated polymer concrete since 1990.

We target two market segments:
Drainage and Architecture.

With a qualified personable team, technological training, and the know-how acquired over many years of experience, we now offer drainage solutions for a globalized world.

DRAINAGE AND ARCHITECTURE

- for people by people -

Our certificates

Solutions for Architecture

For our architecture segment, we offer three comprehensive solutions for both new builds and refurbishments.

- **VENTILATED FACADES**
- **ARCHITECTURAL PRECAST**

Our group

ULMA Architectural Solutions is part of **ULMA Group**, one of the Basque Country's leading industrial groups, which, in turn, is part of **MONDRAGON**, the largest cooperative group in the world.

It currently has a **significant network of subsidiaries in countries on all five continents**. In 2019 we **directly employed more than 5200 people**, with turnover reaching over **900 million euros**.

Our material

Polymer Concrete is a high quality material composed of a select combination of silica and quartz aggregates.

It is ideal for the evacuation of fluids

The polymeric nature of this material allows smooth surfaces with very low friction on prefabricated elements, thereby facilitating the rapid run-off of fluids and also offering a water absorption index which is virtually non-existent, compared with 5-10% with traditional concrete.

COMPRESSIVE STRENGTH

Applied to prefabricated systems, it can support up to 1300 kp/cm² compared to the 700 kp/cm² supported by fibre cement or 500 kp/cm² supported by traditional concrete. **Before breaking or cracking!**

ABRASION RESISTANCE

The hardness of the silica aggregates guarantees good conservation of surfaces exposed to road traffic. **Optimal abrasion resistance!**

RESISTANCE

■ POLYMER CONCRETE
■ FIBRE-REINFORCED CONCRETE
■ TRADITIONAL CONCRETE

RESISTANCE TO CHEMICALS

One of the most resistant materials to any chemical product. Its components do not react to contact and prevent disintegration and deformation. **Proven!**

FLEXURAL STRENGTH

Applied to prefabricated systems, it can support up to 18-25 MPa compared to the 15-20 supported by fibre cement or the 1-5 MPa supported by traditional concrete. **Before breaking or cracking!**

SHOCK RESISTANCE

As it is a composite material, it guarantees the perfect conservation of surfaces against usage or the passing of time. **No perception of wear!**

ZERO WATER ABSORPTION

It has practically 0% water absorption and guarantees the sealing of the pieces. **Impermeable!**

UNALTERABLE IN FREEZE/THAW CYCLES

On the contrary to traditional materials it is not affected by freeze-thaw cycles and prevents the appearance of fissures or cracks.

It maintains all properties intact!

LIGHTWEIGHT

Thanks to its excellent mechanical properties, it allows pieces with a finer profile and smaller dimensions to be made.

We offer the best drainage system

We are committed to **sustainable water management**.

The importance of a good drainage system lies not only in the need for rapid discharge of surface water, but also in doing so in a rational manner, with lower peak flows and adequate quality.

Today, when rationalisation of resources is becoming increasingly important in society and in environmental policies, ULMA is committed to working alongside developers and designers to ensure sustainable urban drainage systems in town planning.

WHY LINEAR DRAINAGE

Our duct and drainage system is based on **LINEAR DRAINAGE**, which offers many advantages over point drainage.

What sets us apart

THE BENEFITS OF POLYMER CONCRETE IN DRAINAGE CHANNELS

Polymer concrete manufactured by ULMA is an excellent material for surface drainage channels.

Apart from its outstanding properties in terms of strength, the resins that make up polymer concrete provide an extremely smooth surface compared to traditional concrete. This gives the channels up to 30% more hydraulic capacity, bringing a reduction in hydraulic section. This fact, combined with narrower sections thanks to the material's strength characteristics, ensures more optimised channels.

In addition to the proven quality of the material, this reduction in the size of the channels brings a series of benefits in terms of installation, particularly with regard to cost and time savings.

**HIGHER
MECHANICAL
STRENGTH**

**GREATER
HYDRAULIC
CAPABILITY**

**MORE
OPTIMISED
CHANNELS**

- Quicker installation.
- Lighter.
- No need for special machinery.

- Narrower gratings.
- Aesthetics.

- Cheaper transport and storage.
- Cost savings.

- Room for other parallel facilities, kerbs...
- Less digging.
- Less volume of concrete needed.

**+30%Q
ULMA**

Our complete drainage system

We offer **complete drainage system** with all the required products, from water collection up to the point of discharge, with a range of channels that adapt to the requirements of each project, manufactured in accordance with Standard UNE EN-1433.

CHANNELS
SUMP UNITS
GRATINGS
LOCKING SYSTEM
BUCKET
LATERAL OUTLETS
END CAPS

• SLOPE CONFIGURATIONS

WITHOUT SLOPE

All of the channels are placed at the same height.

Advantages: Very simple from an execution point of view. It has a hydraulic capacity sufficient for short stretches of drainage.

PRESLOPED

Channels of variable height with a built-in slope of 0.5% and 2.5%, according to the model.

Advantages: Very appropriate for areas where the ground has no natural slope.

CASCADE SLOPE

A combination of straight channels of various heights that are joined using step connectors.

Advantages: Simple and economic onsite execution when slopes need to be included.

MIXED SLOPE

A combination of the previous systems.

Advantages: Very appropriate to drain long-length stretches. It allows for the optimization of hydraulic capacity to the utmost.

We are focused on customers' needs

We offer a complete range of gratings in various materials and designs.

In addition to gratings for pedestrian and vehicle use, we have a wide range of gratings for heavy-duty areas such as ports, docks and airports. All our gratings are designed according to the European Standard EN-1433 which regulates covering and sealing devices for use in pedestrian and vehicle circulation areas, classifying the gratings in six categories, in accordance with the place of installation.

GALVANISED & STAINLESS

COMPOSITE

DUCTILE IRON

DUCTILE IRON STAINLESS

• LOCKING SYSTEMS

CLICK LOCKING SYSTEM WITHOUT SCREW

- Especially for channels with no galvanized edge, nor cast iron edges.
- Specific for A15 load classes.
- No screws.

LOCKING BAR AND SCREW

- Channels with and without edge-on.
- Up to load class C250.
- Two locking bars and two screws per LM

SCREW TO THE CHANNEL BASE

- Channels with or without edges.
- Up to load class C250.
- Two screws per LM.

BOLTLESS LOCKING SYSTEM

- Channels with profile
- Up to load class D400
- 8 fixing points per LM

rapidlock

8 BOLTS PER GRATING

- Channels with galvanized or cast iron edges.
- Load classes from D400 up to F900.
- 8 screws per LM.

Solution adapted to your project

1. LOAD CLASSES

Suitable channels must be chosen for each type of application, based on load class, in order to ensure they meet the strength capacity requirement. At ULMA we have channels for all types of applications.

A15

B125

C250

D400

E600

F900

STANDARD EN 1433

The products set out in this Technical Dossier are designed under the premises of Standard EN 1433 "Drainage channels for vehicular and pedestrian areas. Classification, design and testing requirements, marking and evaluation of conformity".

2. HYDRAULICS

ULMA Architectural Solutions
Hydraulic Calculation software

OPTIMAL DRAIN
by ULMA

SIMPLICITY

It only requires a few project parameters, such as line lengths, catchment areas, slopes and run-off coefficients of each surface, to accurately reflect the current situation and the subsequent study.

PRECISION

To calculate the water's behaviour in the channels a mathematical model is used that takes the Spatially Varied Flow with Increasing Flow for Open Channels as the base, which describes the water's behaviour more accurately than other commonly used models and formulas.

COST REDUCTION

The software optimises the cost of channel lines by selecting the most appropriate channel for the application, the exact location of intermediate outlets or the exact distribution of channels in cascade slope.

To ensure drainage systems with optimal evacuation capacity and cost, ULMA Architectural Solutions has developed a multi-platform software solution offering the possibility of performing a hydraulic study for each project and precisely defining the most suitable channel.

MULTIPLE FUNCTIONALITIES

You can enter different rainfall data for any geographic area worldwide, calculate different channel lines in the same project and find the right channel among hundreds of references in ULMA's extensive catalogue, based on their Heights, Widths, Sections, Load Classes or other characteristics.

DETAILED REPORT

As a result we obtain a report with references and dimensions of the necessary channels, sheet of water, filling percentages, water flows and speeds in each of the project lines. All the necessary data for the validation of the drainage system.

Qref

The value shown as Qref in the product datasheets refers to the maximum flow rate for a length of 10 metres and 0% slope.

3. APPLICATION

Each area of application has its own requirements, and at ULMA we have a wide variety of products and materials to respond to each of them. Checking with the technical department is recommended in order to ensure a correct choice.

ENVIRONMENTAL REQUIREMENTS

Using channels with stainless steel profiles or ductile iron edges, along with gratings in the same material, is recommended for environments with high salinity, as well as places where chemicals are used.

USE REQUIREMENTS

We have a wide range of gratings to meet the requirements of different Standards.

LET US ADVISE YOU

Improve safety

With its many years of experience in the area of surface drainage, ULMA's technical department is at your disposal to accompany you throughout the entire project.

SETTING-OUT THE DRAINAGE LINES

Send us your plans and we will help you design the best way to drain the surface of your project. We will also advise you on choosing the right kind of resistance for the channels and gratings depending on their use and location.

CHOOSING THE MOST OPTIMAL CHANNEL AND GRATING

With our Optimal Drain hydraulic calculation, we will find the optimal channel with the lowest possible cost.

COMPLETE DRAINAGE SYSTEM

We will advise you to ensure your drainage project is as complete as possible. We will develop the exploded view of the entire system to ensure no element or accessory is missing. Sump units, connectors, covers...

DOCUMENTATION FOR THE PROJECT

We will provide you with all the necessary documentation for the project. Data sheets, plans, files, BIM, DOP, quality control certificates...

ADVICE ON INSTALLATION ON SITE

After we send you the material, we will still be there. We will advise you on installing the channels, defining the necessary concrete reinforcement, in addition to being present on site if required.

> Domestic drainage

> Technical drainage

> Civil drainage

Domestic drainage

Self

Channels for pedestrian use and occasional car traffic, for areas with low hydraulic requirements. Using a channel with a built-in profile is recommended, especially when finished with concrete or asphalt paving and/or with frequent passage of vehicles.

Applications

Secondary streets, squares, playgrounds, schools, parks, gardens, etc.

Load class up to C250 (according to model).

Mini

Channels designed for areas with height limitation, pedestrian use and occasional traffic. Using a channel with a built-in profile is recommended, especially when finished with concrete or asphalt paving and/or with frequent passage of vehicles.

Applications

Reinforced slabs, garage flooring structure, basements, showers, changing rooms, roofs, etc.

Load class up to C250 (according to model).

Urban

Channels for pedestrian use and occasional car traffic, for all types of hydraulic requirements. Using a channel with a built-in profile is recommended, especially when finished with concrete or asphalt paving and/or with frequent passage of vehicles. Option of built-in slope, mixed slope or cascaded slope.

Applications

Pedestrian areas, sports facilities, residential complexes, car parks for light vehicles, etc.

Load class up to C250 (according to model).

Sport

Drainage channels for sports and recreation facilities.

Applications

Football pitches, running tracks, showers, changing rooms, swimming pool paving, etc.

Load class up to C250 (according to model).

Hydro

Polypropylene drainage channels for pedestrian use and occasional car traffic, for areas with low hydraulic requirements.

Applications

Secondary streets, squares, playgrounds, schools, parks, gardens, etc.

Load class up to C250 (according to model).

Technical drainage

MultiV+

Channels with versatile uses suitable for intermediate loads and road traffic for areas with low and medium hydraulic requirements. Optimised V-shaped section with self-cleaning effect.

- Rapidlock® locking system
- Mechanical stability in 8 locking points
- Option of built-in slope, mixed slope or cascaded slope.

Applications

Pedestrian areas, commercial areas, and car parks for all types of vehicles.

Load class up to D400

Civil drainage

Civil - S

Channels for large loads in areas with height limitations. Locking system with 8 bolts per linear metre.

Applications

Reinforced slabs, garage flooring structure, service stations, loading and unloading areas, industrial buildings, public roads, heavy vehicle car parks, etc.

Load classes up to F900

Civil - F

Drainage channels for large loads and all types of hydraulic requirements. Option of built-in slope, mixed slope or cascaded slope. Locking system with 8 bolts per linear metre.

Applications

Service stations, port loading and unloading areas, industrial buildings, airports, public roads, heavy vehicle car parks, etc.

Load classes up to F900

KompaqDrain®

Monolithic channel with built-in grating in a single body, for medium or high loads, specially designed for intense vehicle traffic. Useful for all types of hydraulic requirements.

Incorporates innovative MAXFLOW system, which increases water speed.

Applications

Motorways or dual carriageways, airports, service stations, and areas with heavy traffic.

Load classes up to F900

Slotted

Hidden drainage grating solution, applicable to almost the entire range of channels, for all hydraulic requirements. In galvanised or stainless steel.

Load classes up to D-400

Other solutions

Cable ducts

Industrial skirting

Trenches

Runways

...and more.

DOMESTIC

DRAINAGE

SELF

SYSTEM

Interior streets, gardens, recreational areas, squares, parks...

Multipurpose, constant height channels (without slope), very practical in short drain stretches or with frequent outlets.

Available with various grating locking systems (quick system, locking bars, with screws), all types of grating materials up to load class C250.

TECHNICAL DRAINAGE

MULTIV+

SYSTEM

**Pedestrian areas, commercial areas,
and car parks for all types of vehicles.**

DRAINAGE EVOLUTION

The evolution of R&D processes and our 20+ years of experience in drainage solutions has enabled us to develop a new line of products better suited to market needs, providing in a single system the advantages of our other lines: the economy of the SELF system, the low heights of the MINI range, the 8-point fastening of the F line and the option of presloped, cascaded or mixed slope provided for by the U and UK systems.

The **MULTIV+®** is available in different heights, and up to a load class of D400.

ADVANTAGES OF THE MULTIV+ SYSTEM

01. MULTIV+ OPTIMIZED V-SHAPED SECTION

Especially designed for channel runs with no longitudinal slope

- + Higher speed with lower flows
- + Bigger capacity for extreme flows

The V-shaped design of the MULTIV+® channels has been developed to drain water faster, improving the self-cleaning effect of the channel. Its optimized cross section, larger than the traditional V-sections currently available on the market, provides bigger hydraulic capacity for extreme flow situations.

02. *rapidlock* FASTENING SYSTEM

The fast and boltless ULMA Rapidlock® fastening system makes possible to connect the grating to the channel body quickly, safely and practically effortlessly.

- One-second fastening
- Tool-free installation
- Save on labour costs
- Easy maintenance

03. MECHANICAL STABILITY, WITH 8 FASTENING POINTS

Its 8-point fastening system provides higher stability and stress distribution throughout the grating and the channel.

04. MULTIPLE FASTENING OPTIONS

Rapidlock® and screw-fastened systems can be replaced and combined with blocking

- Even with already installed channels.
- No need to replace the grating.
- By simply replacing the fastening components.

SYSTEM FEATURES

Load Class
up to D400 (1)
EN-1433 Standard

MULTIV+100

SLOPE
0,5%

ULMA Linear Drainage Channel, type MULTIV+ R100G; External width 136 mm, Internal width 100 mm, with overall heights between 80 and 300 mm; suitable for cascade-type slopes to collect rainwater; sections 1 LM in length; optimized V-shape with self-cleaning effect; especially designed for channel runs with no longitudinal slope; galvanised steel or ductile iron edges (2) for lateral protection; Either **Rapidlock®** boltless system or screw-fastened. 8 locking points per linear metre.

CIVIL-F

SYSTEM

Motorways and airports, loading and unloading areas, ports...

Channels with attachment of the grating to the channel with 4 screws per grating, designed for heavy traffic areas and especially for sections where the grating is subject to large axial forces due to the manoeuvring and braking of vehicles, such as service stations, loading and unloading areas in ports and warehouses, airports, public roads, car parks for heavy vehicles, etc.

The channels are reinforced with galvanised steel profiles at the sides. It is possible to incorporate a continuous 2.5% slope and or cascaded slope.

Available with modular cast iron grating with a load class of up to F900.

ULMA Linear Drainage Channel type F150K: External width 206 mm; Internal width 150 mm; Available with overall heights between 145 mm and 370 mm. Suitable for 2,5% presloped, cascaded or mixed slope, to collect rainwater, in 1 metre long units. Safe locking system consists of eight bolts per LM; Integrated galvanised steel* edges for lateral protection.

* Also available with cast iron edges.

KOMPAQDRAIN®

SYSTEM

A monolithic system specially designed for areas with high traffic density by ULMA Architectural Solutions, specialists in drainage system, this novel compact channel made of polymer concrete, is suitable up to load class F900, according to standard EN-1433.

Motorways, airports, service stations and other intense traffic areas require high drainage and maximum safety, requirements to which **KOMPAQDRAIN®** responds with a combination of features that make it unique on the market.

These channels offer different surfaces according to its use.

KOMPAQDRAIN® ADVANTAGES

ACCESS UNIT

MAX FLOW® SYSTEM

The original curved design of the inlets, together with the non-slip surface and water router, achieve the novel **Max Flow®** effect, **increasing the water speed and the drainage capacity**. Moreover, the progressive widening of the orifices helps the waste pass through more easily. Therefore **KOMPAQDRAIN®** can drain the same volume of water with a smaller channel.

KOMPAQDRAIN® meets all requirements of the EN-1433 international standard of quality and reliability.

CURVED DESIGN OF THE INLETS

IT INCREASES THE WATER ENTRY SPEED AND THE DRAINAGE CAPACITY

PROGRESSIVE WIDENING TO PREVENT DIRT BLOCKAGE

KOMPAQDRAIN® OVERVIEW

Load Class
up to D400
EN-1433 Standard

KOMPAQ100 CITY CE

Linear Drainage Channel model **ULMA KompAQDrain® City KVDH100**, with an integral grating, presented in one-piece and manufactured by high resistant Polymer Concrete. Vandal - proof and corrosion resistant. Load class up to D-400, for all type of vehicles crossing and with reduced capture holes of 8 mm. With "V" optimized shaped and capture holes with MAX-FLOW® geometry: self-cleaning effect at a low flow, increase at maximum flow and positive opening in order to avoid dirt blockage, for areas without slope. Active surface for cutting of water sheet and for its driving to uptake holes and with non-slippery protuberances. Male and female horizontal and vertical alignment and perimeter preformed groove to facilitate joint sealing in 360°.

The access unit and the sump unit include: cast iron grating FNHX100FTDM, lateral preforms for horizontal outlets on each side and lateral preforms for connections in T, L and in cross.

KOMPAQ150 TRAFFIC CE

Linear Drainage Channel model **ULMA KompaqDrain® Traffic KVFD150**, with an integral grating, presented in one-piece and manufactured by high resistant Polymer Concrete. Vandal – proof and corrosion resistant. Load class up to D-400, for all type of vehicles crossing. With “V” optimized shaped and capture holes with MAX-FLOW® geometry: self-cleaning effect at a low flow, increase at maximum flow and positive opening in order to avoid dirt blockage, for areas without slope. Active surface for cutting of water sheet and for its driving to uptake holes and with non-slippery protuberances. Male and female horizontal and vertical alignment and perimeter preformed groove to facilitate joint sealing in 360°.

The access unit and the sump unit include: cast iron grating FNHX150FTDM, lateral preforms for horizontal outlets on each side and lateral preforms for connections in T, L and in cross.

KOMPAQ200 CIVIL CE

Linear Drainage Channel model **ULMA KompaqDrain® Civil KVF200**, with an integral grating, presented in one-piece and manufactured by high resistant Polymer Concrete. Vandal – proof and corrosion resistant. Load class up to F-900 for high loads. With “V” optimized shaped and capture holes with MAX-FLOW® geometry: self-cleaning effect at a low flow, increase at maximum flow and positive opening in order to avoid dirt blockage, for areas without slope. Active surface for cutting of water sheet and for its driving to uptake holes and with non-slippery protuberances. Male and female horizontal and vertical alignment and perimeter preformed groove to facilitate joint sealing in 360°.

The access unit and the sump unit include cast iron grating FN200FTM, lateral preforms for horizontal outlets on each side and lateral preforms for connections in T, L and in cross.

SLOT

GRATINGS

The SLOT Drainage is part of an integral system, consisting of a discrete slot, a channel body and an access unit for an optimal maintenance of the drainage system. It is an inverted "T" or "L" shaped grating model, that stands out mainly for its aesthetics, since it integrates perfectly in the pavement (either concrete, paving stone or tiles) achieving a total blend with the urban landscape. Supports a load class up to D-400 according to Standard EN1433.

GRATINGS CLASSES

The grating can be either single or double slot for greater hydraulic efficiency, and offset to install close to walls.

SINGLE SLOT
Aesthetic solution.

DOUBLE SLOT
Same solution with greater hydraulic capacity.

OFFSET SLOT GRATE
Ideal solution for areas near walls.

MATERIAL

Available in GALVANIZED STEEL as well as in STAINLESS STEEL (AISI 304 and AISI 316L) for the most demanding of hygiene.

Please consult our technical department with any queries regarding the application of materials and installation.

DRAINAGE SYSTEM

WITH SLOT GRATING

MAINTENANCE

Steps to follow for the correct removal of the access unit and cleaning of the drainage system.

ULMA® DRAINAGE SYSTEM INSTALLATION INSTRUCTIONS

1. Initial conditions

The purpose of these instructions is to provide general information for successfully installing and operating ULMA Architectural Solutions' channel systems. The construction details refer to specific soil conditions, meaning professional advice is recommended for particular soils and/or local circumstances. We have a team of professionals with extensive experience that can provide advice and a personalised service to our customers in this regard.

The construction details presented are generic and aim to cover the broadest range of construction options, all with the highest guarantees possible. However, this does not exempt the Designer or Project Managers from checking these construction recommendations and making sure they are compatible with the nature of the soil.

This guide provides the basic instructions to ensure the correct operation of the system. Additional reinforcement may be required in special cases or soils with different characteristics, increasing the concrete bedding section or even installing rebars.

Seek advice from the engineering department in order to determine the size of any rebars and how they should be configured. ULMA Architectural Solutions' channelling system has been designed and tested under the stringent provisions of STANDARD EN1433, thus ensuring compliance with requirements for collecting and discharging surface water and absorbing loads generated on flooring. The following conditions must be met in order for the drainage channel system to work properly:

1. Correct design of the project
2. Proper on-site planning
3. Specialist installation
4. Regular maintenance

The following regulations apply to the installation of ULMA Architectural Solutions' drainage systems:

- **UNE EN 1433:2002 + DIN V 19580**
"Drainage channel systems for circulation areas" with regard to classifying and installing the corresponding channel systems.
- **Structural Concrete Instruction (EHE)**, mandatory according to Royal Decree 2661/1998 of 11 December.
- **CE marking of drainage channel systems**, according to Resolution of 12 June 2003, of the Directorate General of Technology Policy. State Journal no. 165 for harmonised standard EN 1433.
- **Directive 89/106/EC** on construction product marking.
- **Technical Building Code According to Royal Decree 314/2006, of 17 March 2006**, on overall appearance, and specifically Basic Health Document part 5.

2. General installation instructions

2.1 PREPARATORY WORK

The soil must be in good condition, in order to avoid future problems of sinkage and breakage of the channels. The soil should be well compacted if there have been any earthworks, eliminating any soft areas.

The compaction level should be of over 90% of the Proctor standard test and a 95-100% degree of compaction will be required for airports and roads with intense, heavy traffic.

2.2. PREPARING THE TRENCH

Prepare the trench for the base. The trench should be excavated with levelling according to the slope in question, always taking into account dimensions X, Y, Z, as set out in the installation instructions for the channel used.

2.3. SUB-BASE CONCRETE LAYER

Install a sub-base concrete layer and/or a base waterproofing fabric for the channel's foundations.

2.4. POSITIONING THE CHANNELS

Establish an alignment line and prepare the channels along the trench. Check that the arrow on the sides of the channels points to the water discharge point

Open the outputs, always drilling the perimeter of the pre-marked output every 5-6 cm or cutting with an angle grinder.

Pour the concrete (min. HM25) at the base of the trench, checking the thickness required in the relevant drawings, and position the channels before it starts to set. The choice of materials, especially the concrete, is determined by environmental conditions at the place of installation.

The channels must be fitted on the concrete base without leaving any gaps, taking into account the placement direction shown by the arrow moulded on the channel (=direction of flow). Installation must begin at the lowest point, i.e. at the passage to the drain pipe or collector box, where appropriate.

Check the alignment along the trench.

See chapter **3.13 Sealing joints between channels** in these Installation Instructions. This procedure does not guarantee total waterproofing of the drainage line, meaning a waterproofing layer must be provided under the channel when installing in places with high waterproofing requirements, such as petrol stations or roofs of buildings. See chapter **3.4. Channels in places with high waterproofing requirements** in these Installation Instructions.

2.5. CONCRETE BEDDING

Before pouring the concrete for the reinforcement bedding, fit timber battens or protect the gratings with plastic in the channels, thus preventing deformation that will prevent the gratings from being installed.

Pour the concrete through the sides of the channel, making the bedding as shown in the installation drawing.

It is very important to lay both layers within a reasonable time in order to ensure adhesion where two layers of concrete meet.

Where necessary, the “Y” measurement for the side height of the stabilising base relative to the channel body (as shown in the installation details established by ULMA Architectural Solutions) should be adapted on site, in accordance with the construction height of the channel body and the thickness of the flooring that follows it.

If necessary, install the mesh and pour the entire concrete bedding at once.

2.6. POSITIONING THE GRATINGS

Secure the gratings using their fixing system, applying a tightening torque to prevent the grating from moving after vehicles have passed over it. Installing the right fixing system for each use is essential to ensure that the system works correctly. See fixing systems.

2.7. SAFETY MEASURES

The channels must be duly reinforced against horizontal loads for the duration of flooring work on the adjacent sides of the channel, e.g. by installing gratings on the channels (if not already installed).

Mechanical damage to the channels must be avoided when finishing the surfaces adjacent to the channel. The movement of soil compacting elements must therefore be studied in detail before, during and after installing the channel's bedding.

Once finished, the flooring next to the channel must be 3 to 5 mm higher than the channel itself, including the thickness of the grating, and its surface must not cause any slippage.

3. Special installation instructions

3.1. EXPANSION AND CONTRACTION JOINTS

The Designer or Project Manager must draw up a suitable **joints plan** according to the construction details of the base slab and applicable standards and regulations, in order to avoid any tangential or perpendicular stress on the concrete bedding and channel assembly.

If the channels are installed on a concrete slab, expansion joints must be installed between the slab and the bedding in order to prevent expanding concrete from generating stresses on the sides of the channel.

Moreover, **expansion joints must be installed whenever paving, slabs or asphalt** are placed on top of a concrete slab, as described in the concrete installation instructions issued by ULMA Architectural Solutions.

DO NOT place expansion joints **between the channel body and the adjacent flooring**. Such joints must always be between the bedding and the adjacent flooring.

On concrete floors, installing contraction joints every 6 or 7 metres is recommended in order to avoid uncontrolled cracking of the floor.

All contraction joints running transversely to the channel must coincide with the joint between the channels in order to avoid generating tangential forces.

3.2. CHANNELS IN FLOORING WITH PAVING STONES

The joints between the channel body and large paving stones laid on a bed of sand must be **filled** in accordance with the installation details established by ULMA Architectural Solutions, and may use a high-strength material combined with cement or with a synthetic resin-based material, always in accordance with local requirements, in terms of load, strength, etc. Adhering the paving stones to the concrete means they will be an integral part of the channel. The size of the joint depends on the application instructions issued by the manufacturer.

3.3. SLOT CHANNELS

The **installation of channels with single-slot grating** on stone and/or tiled pavements will require the use of a reactive type epoxy adhesive (R) in the joints between the paving stone and grating, as well as in the points indicated in the construction details for this type of installation.

3.4. CHANNELS IN SITES WITH HIGH WATERPROOFING REQUIREMENTS

Channels installed in places with high waterproofing requirements, such as filling stations, terraces, roofs, car parks, etc., must always be placed on a waterproofing layer and/or fabric, following the construction details for this type of installation.

3.5. EXTENDING THE CONCRETE BEDDING

For better load distribution, we recommend extending the concrete bedding at the end of the channel section in longitudinal direction, as described below:

- Type of load A 15 - C 250 $\geq$ 15.0 cm;
- Type of load D 400/E 600 $\geq$ 25.0 cm;
- Type of load F 900 $\geq$ 50.0 cm

3.6. EXTREME LOADS

Areas subject to **extreme loads** include: Container terminals; truck operating areas; truck entrances to sites; busy loading and unloading areas with heavy duty trucks, and similar.

We recommend ULMA F 100 K - F 400 K or ULMA KompaqDrain® channel systems in these cases.

3.7. CHANNELS IN MOTORWAYS AND HIGHWAYS

ULMA's KompaqDrain® system is the only valid system for areas that are transversal to traffic on motorways and highways.

3.8. CHANNELS WITHOUT MESH

ULMA channels meet the requirements for load tests described in the standard, without the need for any reinforcements. Therefore, the minimum cross-sections required for installation do not require the use of reinforcements.

Reinforcements can be used to prevent any retraction of

the concrete bedding, thus ensuring the correct connection between the bedding and the channel in special situations of heavy loads or intense traffic. We recommend contacting the technical department if you have any doubts.

3.9. ZINC-COATED MATERIAL

We recommend not installing zinc-coated products in areas where contact with corrosive agents, such as cleaning products, chlorides, sulphates, acids, bleaches, etc. cannot be ruled out (e.g. swimming pools or marine environments).

3.10. STAINLESS STEEL

During installation, products made of stainless steel must be adequately protected against ferrous oxide dust in the environment, sparks caused by cutting metals, etc. The surfaces should be cleaned at regular intervals to maintain their appearance and prevent corrosion. The type of stainless steel will be chosen in accordance with environment where it is to be installed (AISI 304 for normal environments and AISI316 for marine environments).

3.11. CUTTING THE CHANNEL AND GRATING

All channel and grating elements can generally be cut to a suitable length on site. However, it should be remembered that at least one attachment point per grating should remain accessible. If necessary, remove the burrs from all cut metal edges and ensure there are no sharp edges.

Mitre joints are achieved by cutting the channels to the desired angle and abutting them or joining them with resin. Beveling channels for higher types of load (D400, E600 and F900) is NOT recommended. Mitre joints and couplings can be configured with connecting pipes.

3.12. MOULDED PREFORMS

In principle, vertical moulded preforms in polymer concrete will always be opened/hammered from inside to out. To do this, we recommend making a contour on the outside of the preform with boreholes, and hammering the weakened area with a mallet and chisel. Boreholes can be made with a hand drill.

3.13. SEALING JOINTS BETWEEN CHANNELS

PREPARING SURFACES

Cleaning: The polymer concrete substrate must be cleaned thoroughly before applying any of the sealing elements. The aim is to eliminate any elements that prevent direct contact between the sealing elements and the substrate.

All surfaces that are going to be in contact with the sealing elements must be cleaned (both the groove that will house the sealant and the two front faces of the channels to be joined).

There must be no dirt, dust, grease, oil or any other element wholly or partially covering the substrate and adversely affecting adhesion between the sealing elements and the substrate.

Priming: Applying a cleaning and activation product for priming is recommended once the sealing surfaces have been cleaned. There are specific products for each elastic sealant, which can be used to improve adhesion to the substrate.

It is usually enough to apply a coat of activating cleaner on the surfaces to be treated, and then leaving them to dry. This should be done using a brush, always following the manufacturer's instructions.

APPLYING SEALANT

Either a single-component product or a two-component product can be applied for elastic sealing.

The recommended single-component elastic sealant cures thanks to environmental humidity, and therefore has a variable curing period, depending on the humidity present in the environment.

The two-component elastic sealant recommended for this application is as valid as the single-component product, the only difference being the extra work involved in uniformly mixing the components beforehand, and the fact that workability and application time are limited.

Single-component sealant: Using a single-component sealant is recommended if curing time is not a critical element; in this case, the curing process can be around 2-3 mm after 24-48 hours, always depending on environmental humidity, and it can be applied without first mixing the components.

Two-component sealant: Applying a two-component sealant is recommended if a short or independent curing period is required, in this case consisting of the sealing element itself plus a product that accelerates the curing reaction.

REMARKS

Any action carried out with the recommended products must always be in keeping with the relevant Instructions, Technical Data Sheets and Safety Data Sheets issued by the manufacturer.

The reliability and durability of the sealing solution depend on the specific conditions of each work site: conception and design, conditions, care taken during installation, use and maintenance, local climatological conditions, etc.

Since ULMA Architectural Solutions has no influence over these aspects and cannot guarantee a working life for this sealant solution, it shall not be in any way liable in this regard, with its work being limited simply to recommending a suitable commercial sealant product.

Longitudinal to the traffic direction

Load class EN 1433 Standard	A15	B125	C250	D400	E600	F900 *
Type of concrete EN 206-1 Standard				HM-25 (X0)	HM-25 (X0)	HM-25 (X0)
Minimum distances (mm)	X			200	200	200
	Y			channel height + grid + 3-5 mm		
	Z			200	200	200

*Complies F900 load class without reinforcing wire mesh.

D400 - E600 - F900
Transversal to the traffic direction

Load class EN 1433 Standard	A15	B125	C250	D400	E600	F900
Type of concrete EN 206-1 Standard				HM-25 (X0)	HM-25 (X0)	HM-25 (X0)
Minimum distances (mm)	X			200	200	consult
	Y			channel height + grid + 3-5 mm		
	Z			200	200	

For heavy transversal traffic use always KompaqDrain channels.

Installation minimal conditions. For more details, see installation instructions.
It is the customer's responsibility to make sure that installation instructions are compatible with the type of soil.

GENERAL CONDITIONS OF SALE

1. ORDERS

- 1.1.** To avoid possible errors, orders must be sent signed and stamped to our sales technicians or our customer service department (SAC) by fax or email.
- 1.2.** In the case of orders that include a special piece or custom drawing, they must be signed and stamped along with the other required information.
- 1.3.** Ulma is not responsible for the choice of models and/or materials that are not suitable for the use or load indicated in our recommendations, which are included in our catalogue and on our website (www.ulmaarchitectural.com).

2. PRICES

- 2.1.** The validity of the offer is indicated in the small print on the offer.
- 2.2.** All prices are subject to the relevant VAT or tax.
- 2.3.** ULMA may modify the prices without prior notice, and this document is a brochure with general information and in no case does it act as a contractual document.

3. ASSEMBLY

- 3.1.** ULMA is not responsible for any material assembled without following the manufacturer's installation instructions. These are available on our website: www.ulmaarchitectural.com.
- 3.2.** For any technical information you can consult our technical department

4. SHIPMENTS

- 4.1.** All freight costs shall be indicated in the offers and orders.
- 4.2.** Any claim or incident must be notified to the corresponding commercial technician or to our customer service department within a maximum period of 72 HOURS, indicating the delivery note number and providing photographs demonstrating the reason for the incident.
- 4.3.** Any claim or incident due to BREAKAGE of the material on receipt of the material MUST BE INDICATED ON THE CARRIER'S DELIVERY NOTE.
- 4.4.** The material will be delivered on a lorry.
- 4.5.** The unloading and means of unloading are at the customer's expense.
- 4.6.** No penalties shall be admitted for delays in the supplies, these periods are approximate and shall be indicated in the offers and orders.

5. PAYMENT TERMS

- 5.1.** The terms of payment shall be agreed by both parties and shall be indicated in each offer and in each order.
- 5.2.** For credit operations, and provided it is authorised by ULMA's credit department, the maximum payment period shall not be greater than that indicated in Law 15/2010, of 5 July, published in Official State Gazette 10708 of 7 July. INSOLVENCY LAW
- 5.3.** Repeated failure to meet payment deadlines shall result in the reduction or cancellation of the line of credit.
- 5.4.** In the event of non-payment, ULMA reserves the right to process the payment collection through an independent company. As a first step, the supply of material for this customer shall be cut.
- 5.5.** For new customers and individuals, payment shall be made in advance.
- 5.6.** Withholding due to guarantee shall not be allowed.
- 5.7.** No charges shall be accepted for handling payment documents.

6. RETURNS

- 6.1.** ULMA Hormigón Polímero does not accept returns of material as indicated in all written offers.

7. CONTRACTS

- 7.1.** No other type of contract dated after this agreement shall be accepted, nor shall any additional clauses that contravene those set out in this document.
- 7.2.** If the customer is required to enter a contract, the contract must be entered before the order is processed, ULMA will not process any order until the contract is in its possession, duly completed and signed by both parties.

8. JURISDICTION

- 8.1.** Any lawsuit arising from the commercial relationship shall be resolved in the courts determined by ULMA.
- 8.2.** The technical information contained in this document is the information in force at date of printing, therefore, in order to update this information, we recommend you visit our website ulmaarchitectural.com.
- 8.3.** ULMA reserves the right to modify the specifications of any of its products without prior notice.
